

Experiment 6: Fuzzy Logic and Constraint Satisfaction

Aim

To implement a simple fuzzy logic system and solve a constraint satisfaction problem using given rules and constraints.

Exercises

1. Create a fuzzy logic system to determine “student performance” based on attendance and marks.

Observe: How the output changes for different attendance and marks values.

2. Create a simple “timetable problem” using variables, possible time slots, and constraints.

Observe: The timetable generated without violating the given constraints.

3. Change some fuzzy rules or constraints and run the program again.

Observe: how the changes affect the final output or solution.
